PROBLEM STATEMENT:

The food and beverage industry generates a large amount of sales data from various products, sales channels, and time periods. However, analyzing this raw data manually makes it difficult for businesses to understand sales performance, customer purchasing patterns, and revenue trends. Without proper analysis, it becomes challenging to identify which product categories perform better, which sales channels generate higher revenue, and how sales change over time. Understanding these patterns is important for businesses to evaluate their performance and make informed decisions.

PROPOSED SOLUTION:

- The proposed system aims to analyze food and beverage sales data to understand sales performance, revenue trends, and customer purchasing behavior. The system uses data analytics and visualization techniques to transform raw sales data into meaningful insights through an interactive dashboard. The solution consists of the following components:
- **Data Collection:**
  Collect historical sales data containing information such as order number, product details, quantity, unit price, sales channel, salesperson, and order date. This data helps analyze revenue generation and sales performance across different categories and channels.
- **Data Preprocessing:**
  Clean and organize the collected data by handling missing values, correcting inconsistencies, and ensuring proper data types. A calculated column called **Sales Amount** is created by multiplying quantity and unit price. Measures such as **Revenue**, **Orders**, and **Average Ticket Price (ATP)** are calculated for further analysis.
- **Data Analysis:**
  Analyze the prepared data to identify important business metrics and trends. The analysis focuses on revenue distribution, number of orders, product category performance, sales channel contribution, and salesperson performance.
- **Dashboard Development:**
  An interactive dashboard is developed using **Microsoft Power BI** to visualize sales data. Various charts and visualizations are used to represent revenue trends, product performance, and sales distribution across different channels and time periods.
- **Evaluation:**
  The dashboard is evaluated by verifying calculated measures and ensuring that visualizations accurately represent the data. Filters and interactive features allow users to explore sales insights effectively.
- **Result:**
  The system provides clear insights into sales performance, helping businesses identify top-performing products, profitable channels, and overall revenue trends to support better decision-making.

SYSTEM APPROACH:

The **System Development Approach** describes the tools and methodology used to develop the food and beverage sales analysis dashboard.**System requirements**

- **Requirements:**
  Computer system with required software support for data analysis and dashboard development.
- **Software:**
  Microsoft Power BI is used for data analysis, data modeling, and dashboard visualization.
- **Data:**
  Sales and product datasets containing order details, product information, quantity, and price.
- **Processing:**
  Data cleaning and transformation are performed to prepare the dataset for analysis.
- **Calculations:**
  Calculated column and measures such as **Sales Amount, Revenue, Orders, and Average Ticket Price (ATP)** are created.
- **Visualization:**
  Charts, graphs, and KPI cards are used to display sales insights in an interactive dashboard.

Sales dataset containing order details, quantity, price, and sales information.

ALGORITHM & DEPLOYMENT:

- **Algorithm Selection:**
  - Used a **data analysis approach** to evaluate sales performance.
  - Calculated columns and **DAX measures** were chosen to compute key metrics like **Revenue, Orders, and Average Ticket Price (ATP)**.
  - This approach was selected because it fits the available sales and product data and gives clear business insights.
- . **Data Input:**
  - **Sales Data:** Order Number, Product ID, Quantity, Unit Price, Sales Channel, Salesperson, Order Date.
  - **Product Data:** Product ID, Product Name, Product Category, Supplier/Brand, Unit Cost (optional).
- **Computation Process:**
  - Added **Sales Amount column** in Sales Data: Sales Amount = Quantity × Unit Price (formatted as currency).
  - Created **DAX measures**:
    - Revenue = Sum of Sales Amount
    - Orders = Distinct count of Order Number
    - ATP = Revenue ÷ Orders
  - Product Data used to analyze revenue per product and per category.
- **Deployment:**
  - Developed **Power BI dashboard** with interactive charts, cards, and filters.
  - Dashboard enables analysis of **revenue trends, product performance, and sales channel contributions**.

DAX Measures:

- **Revenue, Orders, and ATP** calculated using **DAX measures** in Power BI.
- **Purpose:** Quickly analyze sales performance, track revenue trends, and understand customer purchasing patterns.

```
Sales Amount  = Sheet1[Quantity]*Sheet1[UnitPrice]

Revenue = SUM(Sheet1[Sales Amount])

Orders = DISTINCTCOUNT(Sheet1[OrderNumber])
```

Average Ticket Price:

```
ATP = DIVIDE('product'[Revenue],'Product'[Orders],"")
```

Key Metrics with Icons:

- Icons visually represent each metric for easier interpretation.
- Helps users quickly identify **Revenue**, **Average Ticket Price (ATP)**, **Total Orders**.

RESULT:

- The dashboard shows key business metrics including **Total Revenue (17.91M)**, **Total Orders (52.6K)**, and **Average Ticket Price (ATP 340.7)**.
- Sales performance is analyzed across **product categories (Food and Drink)** and **different sales channels (Retail, Distributor, Online)**.
- Monthly and quarterly visualizations help identify **sales trends and seasonal patterns**.
- Product group analysis highlights **top-performing products contributing to higher revenue**.
- Salesperson performance analysis shows **individual contribution to total revenue and orders**.
- Interactive filters allow users to analyze sales data by **product category, sales channel, and quarter**.

CONCLUSION:

- The Food and Beverage Sales Analysis Dashboard provides clear insights into **revenue, orders, and average ticket price (ATP)**.
- It helps analyze **sales trends across product categories, channels, and time periods**.
- Interactive visualizations and filters make it easier to **explore sales performance and identify key patterns**.
- Challenges included **data cleaning and ensuring accurate calculations for sales metrics**.
- The dashboard supports **better business understanding and data-driven decision making**.

FUTURE SCOPE:

- The dashboard can be enhanced by integrating **additional data sources** such as customer data and inventory information for deeper analysis.
- Advanced analytics techniques can be added to **forecast future sales trends and demand patterns**.
- The system can be expanded to analyze **multiple regions, stores, or branches** for broader business insights.
- Real-time data integration can enable **live monitoring of sales performance**.
- Additional technologies such as **machine learning and advanced data analytics** can improve prediction and decision support.
